

# Basic Discrete Structure : **Function**

---

Lecture 7-8

# Function

Definition: Let  $A$  and  $B$  be two sets. A function from  $A$  to  $B$ , denoted  $f : A \rightarrow B$ , is an assignment of exactly one element of  $B$  to each element of  $A$ . We write  $f(a) = b$  to denote the assignment of  $b$  to an element  $a$  of  $A$  by the function  $f$ .

# Function

Definition: Let  $A$  and  $B$  be two sets. A function from  $A$  to  $B$ , denoted  $f : A \rightarrow B$ , is an assignment of exactly one element of  $B$  to each element of  $A$ . We write  $f(a) = b$  to denote the assignment of  $b$  to an element  $a$  of  $A$  by the function  $f$ .

# Representing Function

Representations of functions:

1. Explicitly state the assignments in between elements of the two sets
2. Compactly by a formula. (using 'standard' functions)

Example1:

- Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$
- Assume  $f$  is defined as:
  - $1 \rightarrow c$
  - $2 \rightarrow a$
  - $3 \rightarrow c$
- Is  $f$  a function ?
- Yes. since  $f(1)=c$ ,  $f(2)=a$ ,  $f(3)=c$ . each element of  $A$  is assigned an element from  $B$

# Representing Function

Representations of functions:

1. Explicitly state the assignments in between elements of the two sets
2. Compactly by a formula. (using 'standard' functions)

Example 2:

- Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$
- Assume  $g$  is defined as:
  - $1 \rightarrow c$
  - $1 \rightarrow b$
  - $2 \rightarrow a$
  - $3 \rightarrow c$
- Is  $g$  a function ?

# Representing Function

Representations of functions:

1. Explicitly state the assignments in between elements of the two sets
2. Compactly by a formula. (using 'standard' functions)

Example 2:

- Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$
- Assume  $g$  is defined as:
  - $1 \rightarrow c$
  - $1 \rightarrow b$
  - $2 \rightarrow a$
  - $3 \rightarrow c$
- Is  $g$  a function ?
- No. since  $g(1)$  is assigned both  $c$  and  $b$ .

# Representing Function

Representations of functions:

1. Explicitly state the assignments in between elements of the two sets
2. Compactly by a formula. (using 'standard' functions)

## Example 3:

- $A = \{0, 1, 2, 3, 4, 5, 6, 7, 8, 9\}$ ,  $B = \{0, 1, 2\}$
- Define  $h: A \rightarrow B$  as:  
$$h(x) = x \bmod 3.$$
- (the result is the remainder after the division by 3)
- Assignments:
  - $0 \rightarrow 0$       $3 \rightarrow 0$
  - $1 \rightarrow 1$       $4 \rightarrow 1$
  - $2 \rightarrow 2$      ...

# Notation of Set

Definitions: Let  $f$  be a function from  $A$  to  $B$ .

- We say that  $A$  is the **domain** of  $f$  and  $B$  is the **codomain** of  $f$ .
- If  $f(a) = b$ ,  $b$  is the **image** of  $a$  and  $a$  is a **pre-image** of  $b$ .
- The **range** of  $f$  is the **set of all images of elements of  $A$** . Also, if  $f$  is a function from  $A$  to  $B$ , we say  $f$  maps  $A$  to  $B$ .

Example: Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$

- Assume  $f$  is defined as:  $1 \rightarrow c, 2 \rightarrow a, 3 \rightarrow c$
- What is the image of 1?
- $1 \rightarrow c$   **$c$  is the image of 1**
- What is the pre-image of  $a$ ?
- $2 \rightarrow a$   **$2$  is a pre-image** of  $a$ .
- Domain of  $f$  ?  $\{1,2,3\}$
- Codomain of  $f$  ?  $\{a,b,c\}$
- **Range** of  $f$  ?  $\{a,c\}$

# Image of subset

Definition: Let  $f$  be a function from set  $A$  to set  $B$  and let  $S$  be a subset of  $A$ . The image of  $S$  is a subset of  $B$  that consists of the images of the elements of  $S$ . We denote the image of  $S$  by  $f(S)$ , so that  $f(S) = \{ f(s) \mid s \in S \}$ .

## Example:

- Let  $A = \{1, 2, 3\}$  and  $B = \{a, b, c\}$  and  $f: 1 \rightarrow c, 2 \rightarrow a, 3 \rightarrow c$
- Let  $S = \{1, 3\}$  then image  $f(S) = ?$

# Image of subset

Definition: Let  $f$  be a function from set  $A$  to set  $B$  and let  $S$  be a subset of  $A$ . The image of  $S$  is a subset of  $B$  that consists of the images of the elements of  $S$ . We denote the image of  $S$  by  $f(S)$ , so that  $f(S) = \{ f(s) \mid s \in S \}$ .

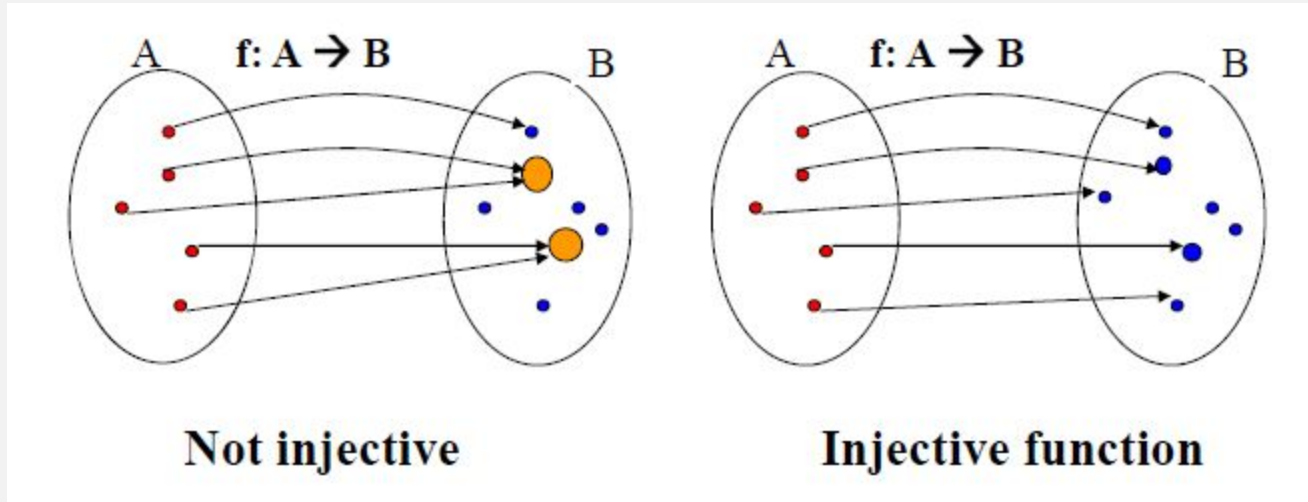

## Example:

- Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$  and  $f: 1 \rightarrow c, 2 \rightarrow a, 3 \rightarrow c$
- Let  $S = \{1,3\}$  then image  $f(S) = \{c\}$

# Injective function

**Definition:** A function  $f$  is said to be **one-to-one**, or **injective**, if and only if  $f(x) = f(y)$  implies  $x = y$  for all  $x, y$  in the domain of  $f$ . A function is said to be **an injection** if it is **one-to-one**.

A **function** for which **every element of the range of the function** corresponds to **exactly one element of the domain**.

# Injective function

Example 1: Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$

- Define  $f$  as
  - $1 \rightarrow c$
  - $2 \rightarrow a$
  - $3 \rightarrow c$
- Is  $f$  one to one?

# Injective function

Example 1: Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$

- Define  $f$  as
  - $1 \rightarrow c$
  - $2 \rightarrow a$
  - $3 \rightarrow c$
- Is  $f$  one to one?
- No, it is not one-to-one
- since  $f(1) = f(3) = c$ , and  $1 \neq 3$ .

Example 2: Let  $g : \mathbb{Z} \rightarrow \mathbb{Z}$ , where  $g(x) = 2x - 1$ .

- Is  $g$  one-to-one?

# Injective function

Example 1: Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$

- Define  $f$  as
  - $1 \rightarrow c$
  - $2 \rightarrow a$
  - $3 \rightarrow c$
- Is  $f$  one to one?
- No, it is not one-to-one
- since  $f(1) = f(3) = c$ , and  $1 \neq 3$ .

Example 2: Let  $g : \mathbb{Z} \rightarrow \mathbb{Z}$ , where  $g(x) = 2x - 1$ .

- Is  $g$  is one-to-one?
- Yes.
- Why?  $g(a) = g(b)$ , i.e.,  $2a - 1 = 2b - 1 \Rightarrow 2a = 2b \Rightarrow a = b$ .

# Surjective function

Definition: A function  $f$  from  $A$  to  $B$  is called onto, or surjective, if and only if **for every  $b \in B$  there is an element  $a \in A$  such that  $f(a) = b$ .**

Alternative: **all co-domain elements are covered**

# Surjective function

**Example 1:** Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$

– Define  $f$  as

- $1 \rightarrow c$
- $2 \rightarrow a$
- $3 \rightarrow c$
- Is  $f$  an onto?

# Surjective function

**Example 1:** Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$

– Define  $f$  as

- $1 \rightarrow c$
- $2 \rightarrow a$
- $3 \rightarrow c$
- Is  $f$  an onto?
- **No.**  $f$  is not onto, since  $b \in B$  has no pre-image.

**Example 2:**  $A = \{0,1,2,3,4,5,6,7,8,9\}$ ,  $B = \{0,1,2\}$

– Define  $h: A \rightarrow B$  as  $h(x) = x \bmod 3$ .

- Is  $h$  an onto function?

# Surjective function

**Example 1:** Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$

– Define  $f$  as

- $1 \rightarrow c$
- $2 \rightarrow a$
- $3 \rightarrow c$
- Is  $f$  an onto?
- **No.**  $f$  is not onto, since  $b \in B$  has no pre-image.

**Example 2:**  $A = \{0,1,2,3,4,5,6,7,8,9\}$ ,  $B = \{0,1,2\}$

– Define  $h: A \rightarrow B$  as  $h(x) = x \bmod 3$ .

- Is  $h$  an onto function?
- **Yes.**  $h$  is onto since a pre-image of 0 is 6, a pre-image of 1 is 4, a pre-image of 2 is 8.

# Bijjective function

Definition: A function  $f$  is called a bijection if it is **both one-to-one and onto**.

Not injective

Injective function

onto

One to one and onto

# Bijjective function

---

Example 1:

- Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$ 
  - Define  $f$  as
    - $1 \rightarrow c$
    - $2 \rightarrow a$
    - $3 \rightarrow b$
- Is  $f$  a bijection?

# Bijjective function

Example 1:

- Let  $A = \{1,2,3\}$  and  $B = \{a,b,c\}$ 
  - Define  $f$  as
    - $1 \rightarrow c$
    - $2 \rightarrow a$
    - $3 \rightarrow b$
  - Is  $f$  is a bijection? Yes. It is both one-to-one and onto.
- Note: Let  $f$  be a function from a set  $A$  to itself, where  $A$  is finite.  $f$  is one-to-one if and only if  $f$  is onto.
- This is not true if  $A$  an infinite set. Define  $f : \mathbb{Z} \rightarrow \mathbb{Z}$ , where  $f(z) = 2 * z$ .  $f$  is one-to-one but not onto (3 has no pre-image).

# Bijjective function

Example 2:

- Define  $g : W \rightarrow W$  (whole numbers), where  $g(n) = \lfloor n/2 \rfloor$  (**floor function**).
- $0 \rightarrow \lfloor 0/2 \rfloor = \lfloor 0 \rfloor = 0$
- $1 \rightarrow \lfloor 1/2 \rfloor = \lfloor 1/2 \rfloor = 0$
- $2 \rightarrow \lfloor 2/2 \rfloor = \lfloor 1 \rfloor = 1$
- $3 \rightarrow \lfloor 3/2 \rfloor = \lfloor 3/2 \rfloor = 1$
- ...
- Is **g** a bijection?
  - **No. g is onto but not 1-1** ( $g(0) = g(1) = 0$  however  **$0 \neq 1$** ).

# Bijjective function

---

Theorem: Let  $f$  be a function  $f: A \rightarrow A$  from a set  $A$  to itself, where  $A$  is finite. Then  $f$  is one-to-one if and only if  $f$  is onto.

Assume

- $A$  is finite and  $f$  is one-to-one (injective)
- Is  $f$  an onto function (surjection)?.

# Bijjective function

**Theorem:** Let  $f$  be a function  $f: A \rightarrow A$  from a set  $A$  to itself, where  $A$  is finite. Then  $f$  is one-to-one if and only if  $f$  is onto.

Proof:

→  $A$  is finite and  $f$  is one-to-one (injective)

- Is  $f$  an onto function (surjection)?
- **Yes.** Every element points to exactly one element. **Injection assures they are different.** So we have  $|A|$  different elements  $A$  points to. Since  $f: A \rightarrow A$  the **co-domain is covered** thus the function is also a surjection (and a bijection)

←  $A$  is finite and  $f$  is an onto function

- **Is the function one-to-one?**

# Bijjective function

**Theorem:** Let  $f$  be a function  $f: A \rightarrow A$  from a set  $A$  to itself, where  $A$  is finite. Then  $f$  is one-to-one if and only if  $f$  is onto.

←  $A$  is finite and  $f$  is an onto function

- Is the function one-to-one?

Yes. Every element maps to exactly one element and all elements in  $A$  are covered. Thus the mapping must be one-to-one

# Bijjective function

Theorem. Let  $f$  be a function from a set  $A$  to itself, where  $A$  is finite. Then  $f$  is one-to-one if and only if  $f$  is onto.

Please note the above is **not true when  $A$  is an infinite** set.

- Example:
  - $f : \mathbb{Z} \rightarrow \mathbb{Z}$ , where  $f(z) = 2 * z$ .
  - $f$  is one-to-one but not onto.
- $1 \rightarrow 2$
- $2 \rightarrow 4$
- $3 \rightarrow 6$
- **3 has no pre-image.**

# Function on Real Number

Suppose  $f: \mathbb{R}^+ \rightarrow \mathbb{R}^+, f(x) = x^2$ .

Is  $f$  one-to-one?

yes

Is  $f$  onto?

yes

Is  $f$  bijective?

yes

# Function on Real Number

Suppose  $f: \mathbb{R} \rightarrow \mathbb{R}^+, f(x) = x^2$ .

Is  $f$  one-to-one?

no

Is  $f$  onto?

yes

Is  $f$  bijective?

no

# Function on Real Number

Suppose  $f: \mathbb{R} \rightarrow \mathbb{R}$ ,  $f(x) = x^2$ .

Is  $f$  one-to-one?

no

Is  $f$  onto?

no

Is  $f$  bijective?

no

# Function on Real Number

Is  $g(x) = x^2 - 2$  onto where  $\mathbb{R} \rightarrow \mathbb{R}$ ?

# Function on Real Number

Is  $g(x) = x^2 - 2$  onto where  $\mathbb{R} \rightarrow \mathbb{R}$ ?

No, Values less than -2 on the y-axis are never used.  
Is it one to one?

# Function on Real Number

Is  $g(x) = x^2 - 2$  onto where  $\mathbb{R} \rightarrow \mathbb{R}$ ?

No, Values less than -2 on the y-axis are never used.

Is it one to one?

No, pair value of x for each y value

# Function on Real Number

Definition: Let  $f_1$  and  $f_2$  be functions from  $A$  to  $\mathbb{R}$  (reals). Then  $f_1 + f_2$  and  $f_1 * f_2$  are also functions from  $A$  to  $\mathbb{R}$  defined by

- $(f_1 + f_2)(x) = f_1(x) + f_2(x)$
- $(f_1 * f_2)(x) = f_1(x) * f_2(x)$ .

## Examples:

- Assume
- $f_1(x) = x - 1$
- $f_2(x) = x^3 + 1$

then

- $(f_1 + f_2)(x) = x^3 + x$
- $(f_1 * f_2)(x) = x^4 - x^3 + x - 1$

# Increasing and Decreasing Function

Definition: A function  $f$  whose domain and codomain are subsets of real numbers is strictly increasing if  $f(x) > f(y)$  whenever  $x > y$  and  $x$  and  $y$  are in the domain of  $f$ .

Similarly,  $f$  is called strictly decreasing if  $f(x) < f(y)$  whenever  $x > y$  and  $x$  and  $y$  are in the domain of  $f$ .

## Example:

- Let  $g : \mathbb{R} \rightarrow \mathbb{R}$ , where  $g(x) = 2x - 1$ . Is it increasing ?

# Increasing and Decreasing Function

Definition: A function  $f$  whose domain and codomain are subsets of real numbers is strictly increasing if  $f(x) > f(y)$  whenever  $x > y$  and  $x$  and  $y$  are in the domain of  $f$ .

Similarly,  $f$  is called strictly decreasing if  $f(x) < f(y)$  whenever  $x > y$  and  $x$  and  $y$  are in the domain of  $f$ .

Example:

- Let  $g : \mathbb{R} \rightarrow \mathbb{R}$ , where  $g(x) = 2x - 1$ . Is it increasing ?

Proof .

For  $x > y$  holds  $2x > 2y$  and subsequently  $2x - 1 > 2y - 1$

Thus  $g$  is strictly increasing.

# Increasing and Decreasing Function

Definition: A function  $f$  whose domain and codomain are subsets of real numbers is **strictly increasing** if  $f(x) > f(y)$  whenever  $x > y$  and  $x$  and  $y$  are in the domain of  $f$ .

Similarly,  $f$  is called **strictly decreasing** if  $f(x) < f(y)$  whenever  $x > y$  and  $x$  and  $y$  are in the domain of  $f$ .

Note: Strictly increasing and strictly decreasing functions are one-to-one.

Why?

# Increasing and Decreasing Function

Definition: A function  $f$  whose domain and codomain are subsets of real numbers is **strictly increasing** if  $f(x) > f(y)$  whenever  $x > y$  and  $x$  and  $y$  are in the domain of  $f$ .

Similarly,  $f$  is called **strictly decreasing** if  $f(x) < f(y)$  whenever  $x > y$  and  $x$  and  $y$  are in the domain of  $f$ .

Note: Strictly increasing and strictly decreasing functions are one-to-one.

**Why?**

**One-to-one function:** A function is one-to-one if and only if  $f(x) \neq f(y)$ , whenever  $x \neq y$ .

# Identity function

Definition: Let  $A$  be a set. The identity function on  $A$  is the function  $i_A: A \rightarrow A$  where  $i_A(x) = x$ .

Example:

- Let  $A = \{1,2,3\}$

Then:

- $i_A(1) = ?$

# Identity function

Definition: Let  $A$  be a set. The identity function on  $A$  is the function  $i_A: A \rightarrow A$  where  $i_A(x) = x$ .

Example:

- Let  $A = \{1,2,3\}$

Then:

- $i_A(1) = 1$
- $i_A(2) = 2$
- $i_A(3) = 3$ .

# Bijjective Function

Definition: A function  $f$  is called a bijection if it is **both** one-to-one **and** onto.

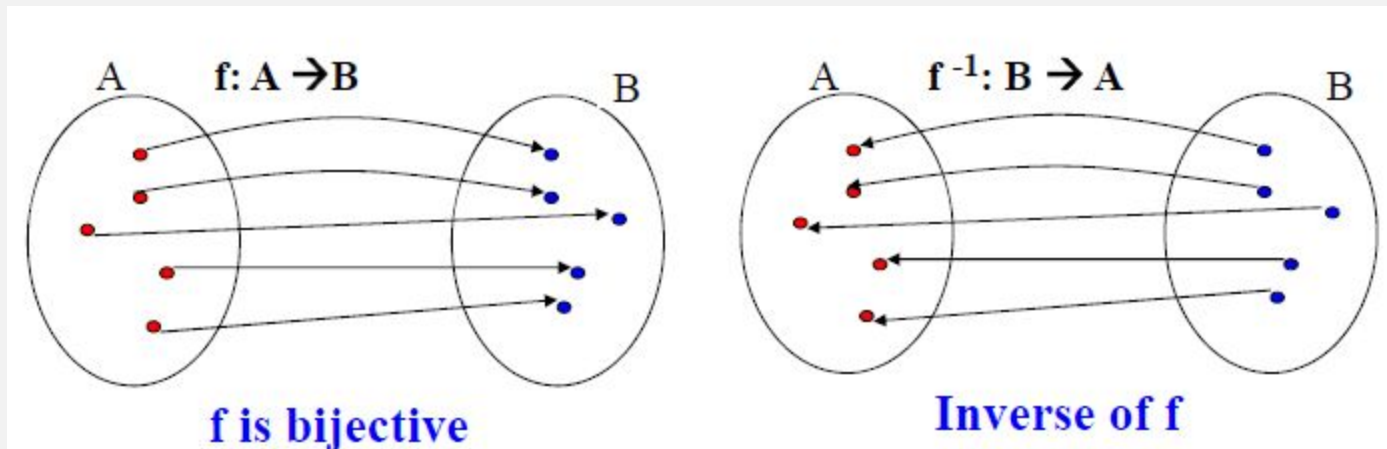

# Inverse Function

Definition: Let  $f$  be a **bijection** from set  $A$  to set  $B$ . **The inverse function of  $f$**  is the function that assigns to an element  $b$  from  $B$  the unique element  $a$  in  $A$  such that  $f(a) = b$ .

The inverse function of  $f$  is denoted by  $f^{-1}$ . Hence,  $f^{-1}(b) = a$ , when  $f(a) = b$ . If the inverse function of  $f$  exists,  $f$  is called invertible.

# Inverse Function

Note: if  $f$  is not a bijection then it is not possible to define the inverse function of  $f$ . **Why?**

Assume  $f$  is **not one-to-one**:  
?

# Inverse Function

Note: if  $f$  is not a bijection then it is not possible to define the inverse function of  $f$ . **Why?**

Assume  $f$  is **not one-to-one**:

Inverse is **not a function**. One element of  $B$  is mapped to two different elements.

# Inverse Function

Note: if  $f$  is not a bijection then it is not possible to define the inverse function of  $f$ . **Why?**

Assume  $f$  is **not onto**:  
?

# Inverse Function

Note: if  $f$  is not a bijection then it is not possible to define the inverse function of  $f$ . **Why?**

Assume  $f$  is **not onto**:

Inverse is **not a function**. One element of  $B$  is not assigned any value in  $A$ .

# Inverse Function

## Example 1:

- Let  $A = \{1,2,3\}$  and  $i_A$  be the identity function
- $i_A(1) = 1$        $i_A^{-1}(1) = 1$
- $i_A(2) = 2$        $i_A^{-1}(2) = 2$
- $i_A(3) = 3$        $i_A^{-1}(3) = 3$
- Therefore, the inverse function of  $i_A$  is  $i_A$ .

# Inverse Function

---

Example 2:

- Let  $g : \mathbb{R} \rightarrow \mathbb{R}$ , where  $g(x) = 2x - 1$ .
- What is the inverse function  $g^{-1}$  ?

# Inverse Function

Example 2:

- Let  $g : \mathbb{R} \rightarrow \mathbb{R}$ , where  $g(x) = 2x - 1$ .
- What is the inverse function  $g^{-1}$  ?

Approach to determine the inverse:

$$y = 2x - 1 \Rightarrow y + 1 = 2x$$
$$\Rightarrow (y+1)/2 = x$$

- Define  $g^{-1}(y) = x = (y+1)/2$

Test the correctness of inverse:

- $g(3) = ..$

# Inverse Function

Example 2:

- Let  $g : \mathbb{R} \rightarrow \mathbb{R}$ , where  $g(x) = 2x - 1$ .
- What is the inverse function  $g^{-1}$  ?

Approach to determine the inverse:

$$\begin{aligned} y &= 2x - 1 \Rightarrow y + 1 = 2x \\ &\Rightarrow (y+1)/2 = x \end{aligned}$$

- Define  $g^{-1}(y) = x = (y+1)/2$

Test the correctness of inverse:

- $g(3) = 2 \cdot 3 - 1 = 5$
- $g^{-1}(5) =$

# Inverse Function

Example 2:

- Let  $g : \mathbb{R} \rightarrow \mathbb{R}$ , where  $g(x) = 2x - 1$ .
- What is the inverse function  $g^{-1}$  ?

Approach to determine the inverse:

$$\begin{aligned}y &= 2x - 1 \Rightarrow y + 1 = 2x \\&\Rightarrow (y+1)/2 = x\end{aligned}$$

- Define  $g^{-1}(y) = x = (y+1)/2$

Test the correctness of inverse:

- $g(3) = 2 \cdot 3 - 1 = 5$
- $g^{-1}(5) = (5+1)/2 = 3$

# Composition of Function

Definition: Let  $f$  be a function from set  $A$  to set  $B$  and let  $g$  be a function from set  $B$  to set  $C$ . The composition of the functions  $g$  and  $f$ , denoted by  $g \circ f$  is defined by  $(g \circ f)(a) = g(f(a))$ .

# Composition of Function

## Example 1:

- Let  $A = \{1,2,3\}$  and  $B = \{a,b,c,d\}$

$g : A \rightarrow A, \quad f: A \rightarrow B$

$1 \rightarrow 3 \quad 1 \rightarrow b$

$2 \rightarrow 1 \quad 2 \rightarrow a$

$3 \rightarrow 2 \quad 3 \rightarrow d$

# Composition of Function

## Example 1:

- Let  $A = \{1,2,3\}$  and  $B = \{a,b,c,d\}$

$$g : A \rightarrow A, \quad f : A \rightarrow B$$

$$1 \rightarrow 3 \quad 1 \rightarrow b$$

$$2 \rightarrow 1 \quad 2 \rightarrow a$$

$$3 \rightarrow 2 \quad 3 \rightarrow d$$

$$g \circ f : A \rightarrow B:$$

- $1 \rightarrow d$
- $2 \rightarrow b$
- $3 \rightarrow a$

# Composition of Function

## Example 2:

- Let  $f$  and  $g$  be two functions from  $Z$  to  $Z$ , where
- $f(x) = 2x$  and  $g(x) = x^2$ .
- $f \circ g : Z \rightarrow Z$
- $(f \circ g)(x) = f(g(x))$   
 $= f(x^2)$   
 $= 2(x^2)$
- $g \circ f : Z \rightarrow Z$
- $(g \circ f)(x) = ?$

# Composition of Function

## Example 2:

- Let  $f$  and  $g$  be two functions from  $Z$  to  $Z$ , where
- $f(x) = 2x$  and  $g(x) = x^2$ .
- $f \circ g : Z \rightarrow Z$
- $(f \circ g)(x) = f(g(x))$   
 $= f(x^2)$   
 $= 2(x^2)$
- $g \circ f : Z \rightarrow Z$
- $(g \circ f)(x) = g(f(x))$   
 $= g(2x)$   
 $= 4x^2$

# Composition of Function

Example 3:

- $(f \circ f^{-1})(x) = x$  and  $(f^{-1} \circ f)(x) = x$ , for all  $x$ .
- Let  $f : \mathbb{R} \rightarrow \mathbb{R}$ , where  $f(x) = 2x - 1$  and  $f^{-1}(x) = (x+1)/2$ .
- $$\begin{aligned}(f \circ f^{-1})(x) &= f(f^{-1}(x)) \\ &= f((x+1)/2) \\ &= 2((x+1)/2) - 1 \\ &= (x+1) - 1 \\ &= x\end{aligned}$$

# Composition of Function

## Example 3:

- $(f \circ f^{-1})(x) = x$  and  $(f^{-1} \circ f)(x) = x$ , for all  $x$ .
- Let  $f : \mathbb{R} \rightarrow \mathbb{R}$ , where  $f(x) = 2x - 1$  and  $f^{-1}(x) = (x+1)/2$ .

- $$\begin{aligned}(f \circ f^{-1})(x) &= f(f^{-1}(x)) \\ &= f\left(\frac{x+1}{2}\right) \\ &= 2\left(\frac{x+1}{2}\right) - 1 \\ &= (x+1) - 1 \\ &= x\end{aligned}$$

- $$\begin{aligned}(f^{-1} \circ f)(x) &= f^{-1}(f(x)) \\ &= f^{-1}(2x - 1) \\ &= (2x)/2 \\ &= x\end{aligned}$$

# Some Function

Definitions:

- The **floor function** assigns a real number  $x$  the largest integer that is less than or equal to  $x$ . The floor function is denoted by

$\lfloor x \rfloor$

- The **ceiling function** assigns to the real number  $x$  the smallest integer that is greater than or equal to  $x$ . The ceiling function is denoted by  $\lceil x \rceil$ .

Other important functions:

- Factorials:  $n! = n(n-1)$  such that  $1! = 1$
